#### **WEDNESDAY, 18 MAY 2022 - MORNING**

## PHYSICS – AS component 1 Motion, Energy and Matter

1 hour 30 minutes

For Examiner's use only								
Question	Maximum Mark	Mark Awarded						
1.	11							
2.	10							
3.	12							
4.	10							
5.	11							
6.	11							
7.	10							
Total	75							

#### **ADDITIONAL MATERIALS**

In addition to this paper, you will require a calculator and a **Data Booklet**.

#### **INSTRUCTIONS TO CANDIDATES**

Use black ink or black ball-point pen. Do not use gel pen or correction fluid.

You may use a pencil for graphs and diagrams only.

Write your name, centre number and candidate number in the spaces at the top of this page.

Answer all questions.

Write your answers in the spaces provided in this booklet. If you run out of space, use the continuation page(s) at the back of the booklet, taking care to number the question(s) correctly.

#### **INFORMATION FOR CANDIDATES**

The total number of marks available for this paper is 75.

The number of marks is given in brackets at the end of each question or part-question.

You are reminded to show all working. Credit is given for correct working even when the final answer is incorrect.

The assessment of the quality of extended response (QER) will take place in 4(a).

[3]

#### Answer all questions.

1.	(a)	(i)	State the difference between vector and scalar quantities.	[1]
		• • • • • • • • • • • • • • • • • • • •		

(ii) Place the following quantities in the correct column in the table below. [2] speed distance displacement work energy acceleration

Vector	Scalar

(b) Showing your reasoning determine the resultant force  $\Sigma F$  in the free body diagram below.

•••••	 	

One of the equations of uniformly accelerated motion is given below: $x = ut + \frac{1}{2}at^2$	
Show that this equation is correct in terms of units. [2]	
An aeroplane has a maximum acceleration on the ground of $3.5\mathrm{ms^{-2}}$ . If its take-off speed is $115\mathrm{ms^{-1}}$ determine the minimum length of the runway required for it to achieve take-off speed. Assume it starts from rest. [3]	
	$x = ut + \frac{1}{2}at^2$ Show that this equation is correct in terms of units. [2] An aeroplane has a maximum acceleration on the ground of $3.5\mathrm{ms^{-2}}$ . If its take-off speed is $115\mathrm{ms^{-1}}$ determine the minimum length of the runway required for it to achieve

(a)	Stat	e Newton's second law of motion in terms of momentum.	[2]
(b)	(i)	Calculate the work done against air resistance during the flight.	[2
	(ii)	By considering the total change in momentum during the flight find the mean fo acting on the ball.	rce [2]
(c)	(i)	A team-mate of the cricketer says the ball will take longer to complete the upwart of the journey than the downward part. Discuss if he is correct.	nrd [2]
	(ii)	At which point during the flight is air resistance at its minimum? Give a reason f your answer.	or [2]

## **BLANK PAGE**

© WJEC CBAC Ltd. (B420U10-1) Turn over.

**3.** Tracey carried out an experiment to accelerate a glider of unknown mass, M, using a series of five different slotted masses each of mass 10 g. The acceleration, a, was found using the following apparatus:

The total mass of the system is kept constant by removing one of the slotted masses from the hanging mass and placing it on the glider. The results were recorded in the table below.

Hanging mass / g	10.0	20.0	30.0	40.0	50.0
Acceleration / ms <sup>-2</sup>	0.23	0.47	0.61	0.89	1.08

Tracey realised the force and acceleration were linked by the following equation:

$$F = (M + m)a$$
 where  $m = 50 g$ 

(a) **Plot a graph** of force against acceleration on the grid opposite. Space has been left below for the force values to be calculated. [3]
